2 Theory of Operation

2.1 Principles of Operation

Infrared, just like any light ray, is an Electromagnetic Radiation, with lower frequency (or longer wavelength) than visual light. Anything above absolute zero (−273.15 degrees Celsius or 0 degrees Kelvin), radiates in the infrared. Even ice cube, snow, your refrigerator emit infrared.

The Stefan-Boltzmann Law, where the total radiation energy is proportional to the fourth power of the absolute temperature and Wien Displacement Law, the product of the peak wavelength and the temperature is found to be a constant, are implemented in the TNm infrared thermometer module. The infrared radiation of measure target is collected by a infrared mirror through a IR filter of 5 or 8μm cut in frequency to the infrared thermopile detector. The detector signal will be amplified and digitalize by the low noise and high linearity OP and AD convertor. The ambient temperature sensor (usually included in the same package as the thermopile detector) is set in the space near the optical system to detect the fast change of the ambient temperature. The signal processing section receives the signals from these temperature sensors to calculate the target surface temperature by a mathematical algorithm.
2.2 Features of Design

The TNm infrared thermometer module is specially designed for a high sensitivity, high accuracy, low noise and low power consumption. A number of design features contribute to the performance:

- MEMS thermopile detector and a high accurate ambient temperature compensation technics care used for the TNm infrared thermometer module.
- ZyTemp has developed a proprietary Infrared-System-On-Chip device that integrates all hardware items onto one IC. Using this innovative SoC technology, TNm infrared thermometer module has become a highly affordable and compact product.
- ZyTemp's products can faithfully withstand a thermal shock of 10degC/18degF. Our products are adept in maintaining accuracies under widely changing environmental conditions. For example, the errors from environmental changes of older IRTs can reach 1.6degC, requiring up to 30 minutes to stabilize, while ZyTemp's TNm error differential is only 0.7degC, needing only 7 minutes to restabilize.
- TNm products operate from a 3 Volt power supply, while many other older IRTs still require a 9 Volt supply.
- ZyTemp has maintained a NIST or National Measurement Laboratory traceable Temperature Primary Standard. All the TNm products are calibrated under traceable infrared standard sources. The calibration data and serial number are saved in a EEPROM on the module.
2.3 Field of View

What is D:S = 1:1
This device has a D:S = 1:1
Distance : Spot = 1:1

When the Distance is 10 inch, then the measurement spot size is also 10 inch.
When the Distance is 20 inch, then the measurement spot size is also 20 inch.
In other words, the FOV(Field of View) is 26.6 x 2 = 53.2 degree

Beware the Vignette
Good Design, No Vignette
Bad Design Vignette
The Sensor “see” the edge of the housing
So the measurement in fact is the averaging of the real target and the edge of housing.

Fig 4. Bad Design Field of View

2.4 Emissivity

Understanding an object's emissivity, or its characteristic "radiance" is a critical component in the proper handling of infrared measurements. Concisely, emissivity is the ratio of radiation emitted by a surface or blackbody and its theoretical radiation predicted from Planck's law. A material's surface emissivity is measured by the amount of energy emitted when the surface is directly observed. There are many variables that affect a specific object's emissivity, such as the wavelength of interest, field of view, the geometric shape of the blackbody, and temperature. However, for the purposes and applications of the infrared thermometer user, a comprehensive table showing the emissivity at corresponding temperatures of various surfaces and objects is displayed. Please visit ZyTemp’s website: http://www.zytemp.com/tutorial/emissivity.asp to check the emissivity of the materials of interested.
3 Specification

3.1 Absolute Maximum Rating

3.4 Pin Assignment of TN0; TN9

Warning: The Dimension in this drawing is for reference only.
For actual dimension, please download from

V: Vdd  G: GND
D: Data (Serial Data)  C: Clock (Serial Clock)
A: Action Pin (pull low to measure, floating while to Write Data into the IRT)

Note: TN0; TN9 has the same pin assignment.
4 Serial Output

4.1 Typical Diagram

TN9 to TTL Interface (MCU)
- V: Vcc
- D: Data
- C: Clock (2KHz)
- G: GND
- A: ActionKey (When Pull Low, the device will measure Tbb continuously.)

Note: Data Pin is High when there is no data out, Time Out > 2ms
4.2 Timing of SPI

Fig 7. Timing of SPI
4.2.1 Format of Message

<table>
<thead>
<tr>
<th>Item</th>
<th>MSB</th>
<th>LSB</th>
<th>Sum</th>
<th>CR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item</td>
<td>“L” (4Ch): Tobj (Temperature of Obj)</td>
<td>8 bit Data Msb</td>
<td>8 bit Data Lsb</td>
<td>Item+MSB+LSB=SUM</td>
</tr>
<tr>
<td></td>
<td>“f” (66h): Tamb (Ambient Temperature)</td>
<td>CR</td>
<td>0Dh, End of the message</td>
<td></td>
</tr>
</tbody>
</table>

4.2.2 Example

1. **Object Temperature (Tbb)**

   - Item: 4Ch → “L” the item code of Object temperature
   - Data:
     - MSB: 14h (“1” and “4” are ASCII char)
     - LSB: 2Ah (“2” and “A” are ASCII char)
   - Real Temperature Value: \( \text{Hex2Dec}(142Ah) / 16 - 273.15 = 49.475 \) °C
   - Sum: CheckSum 4Ch+14h+2Ah=8Ah (Only Low Byte)
   - CR: 0Dh → ‘Carriage Return’ means End of Message

2. **Ambient Temperature (Tamb)**

   - Item: 66h → “f” the item code of Ambient temperature
   - Data:
     - MSB: 12h (“1” and “2” are ASCII char)
     - LSB: C3h (“C” and “3” are ASCII char)
   - Real Temperature Value: \( \text{Hex2Dec}(12C3h) / 16 - 273.15 = 27.03 \) °C
   - Sum: CheckSum 66h+12h+C3h=3Bh (Only Low Byte)
   - CR: 0Dh → ‘Carriage Return’ means End of Message
4.2.3 How to modify the Emissivity? (How to write Emissivity into EEPROM)

*Warning: misuse may result in EEPROM failure, this may destroy the calibration data. The device may become useless!*

1) This Infrared Thermometer module is calibrated with Emissivity=0.95 defaultly. Most of Non-metal material has emissivity near to 0.95. But the infrared emissivity of normal metal is much lower and may have to modify the setting of the module for certain application.

2) The communication format is the same as reading data from the module:
   ItemCode~HighByte~LowByte~CheckSum(ItemCode+HighByte+LowByte)~CR,
   total 40 clocks(& data).
   *Note: the sign “~” is not real data but only means “following by”*

3) For writing Emissivity to TN9, the command is:
   “S”(53h)~HighByte(Emissivity value)~04h~CheckSum(ItemCode+HighByte+04h)~CR(0Dh)

   Emissivity value = HighByte(hex)/100(dec),
   For example: HighByte = 5F(hex)=95(dec) -> emissivity = 95(dec)/100(dec) = 0.95(dec).
   Always keep the LowByte data = 04(hex).
   CheckSum value for this example: 53(hex)+5F(hex)+04(hex)=B7(hex)

4) The trick for write data to TN9 is as below
   a. Action pin need to be floating while writing data to TN9.
   b. As you know, TN9 will do routine data out by 40 clocks & datas with communication format.
      After the 40th clock, TN9 will pull the CLK & DATA pin to weak high for waiting if there is External CPU want write data to TN9.
      Please let External CPU start send 1st clock within the timing T1 after the 40th clock.
      : 5m s   <   T 1   <   10ms
   c. The frequency of CLK should be 2KHz.
   d. TN9 will latch the data at negative edge of CLK, so data should be ready before the negative edge of 1st writing clock.

5) For example,
   Emissivity = 0.95  ==> “S” ~ 5F(hex) ~ 04(hex) ~ B7(hex) ~ CR
   Emissivity = 0.80  ==> “S” ~ 50(hex) ~ 04(hex) ~ A7(hex) ~ CR

6) Finally, how do we know write emissivity success.
   About 5 ms after you send CLK & DATA to TN9 completely.
   TN9 should have 3 kinds of response.
   a. TN9 will send out the same data which External CPU had written to TN9.
      (We call this ECHO). That means write emissivity success.
   b. TN9 will send out “S” ~ FF(hex) ~ FF(hex) ~ CheckSum(“S” + FF + FF) ~ CR.
      That means TN9 find data checksum error = a wrong data receiving.
      TN9 will forget the data, and you need to re-write again.
   c. TN9 have no response as above
      That means TN9 don't get full 40 clocks.
      Please check the clock & data which control by External CPU.
      Especially, please make sure the T1 timing is right.
5 Interface Demo Board: Hub-D

General Description:
Hub-D is an Interface box with LCD, for TN series.
This Box can work as an interface between the IRTm(IRT Module) and PC. see Fig.A “Hub_D” has a 2-column character type LCD Display, it can also work without the PC. The Hub will show Tobj & Tamb (data from the IRTm) continuously.

Model No: Hub-D
Program: TNmDB001.exe

Fig 8. Typical Application of Hub

Fig 9. Hub-D
6 Interface Program for PC

Program: TNmDB001.exe
a Free version for demonstration can be downloaded at http://www.zytemp.com/download/default.asp

- Running under a DOS window (in MS Windows environment)
- Must be used accompanied with HUB-D
- This program will show:
  - Tbb (Tobj) ; Tamb in degC;degF continuously
  - Status of IRT
- Modification of the Emissivity
- degC/degF unit change
